Model Once, Curate Everywhere:
A SHACL-Driven LRMoo-Aligned Knowledge Graph Curation Platform for Musical Philology

Key Concepts

- **WEMI hierarchy:** the Work–Expression–Manifestation–Item model, introduced by IFLA FRBR / LRM, aligned within the CIDOC CRM via FRBRoo, keeps each work apart from its versions (e.g., a libretto), its printed editions, and every surviving copy.
- **One schema, three roles:** a single SHACL schema defines the data model, checks every record, and generates the curation interface.
- **Level-aware authority links:** VIAF attaches at Work, RISM sources at Manifestation, RISM holdings at Item, and SHACL rejects a RISM link at the wrong level.

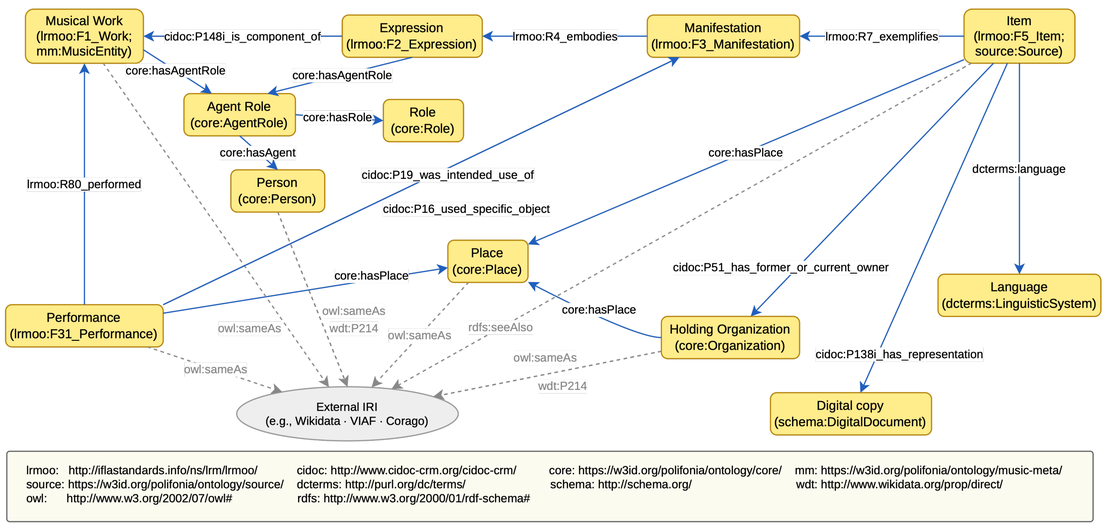

Context and Challenges

Not a new vocabulary/ontology. We re-use and align but also prune to ease curation.

- FRBR/LRMoo, as in Corago: built for books, verbose for complex concepts like operas
- We reuse part of Polifonia, but is designed to complement LRMoo, not replace it
- SHACL form editors (DASH, SHACL UI) need a separate UI layer that drifts from the constraints

Data entry by musicologists, not developers. Model evolves with research.

Simplified representation of the core data model for RFDB

Use Case

How can scholars reconstruct the evolution of a performance when its traces are scattered across languages, documents, and archives?

RossijskijFeatrDB reconnects sources, people, works, places and events

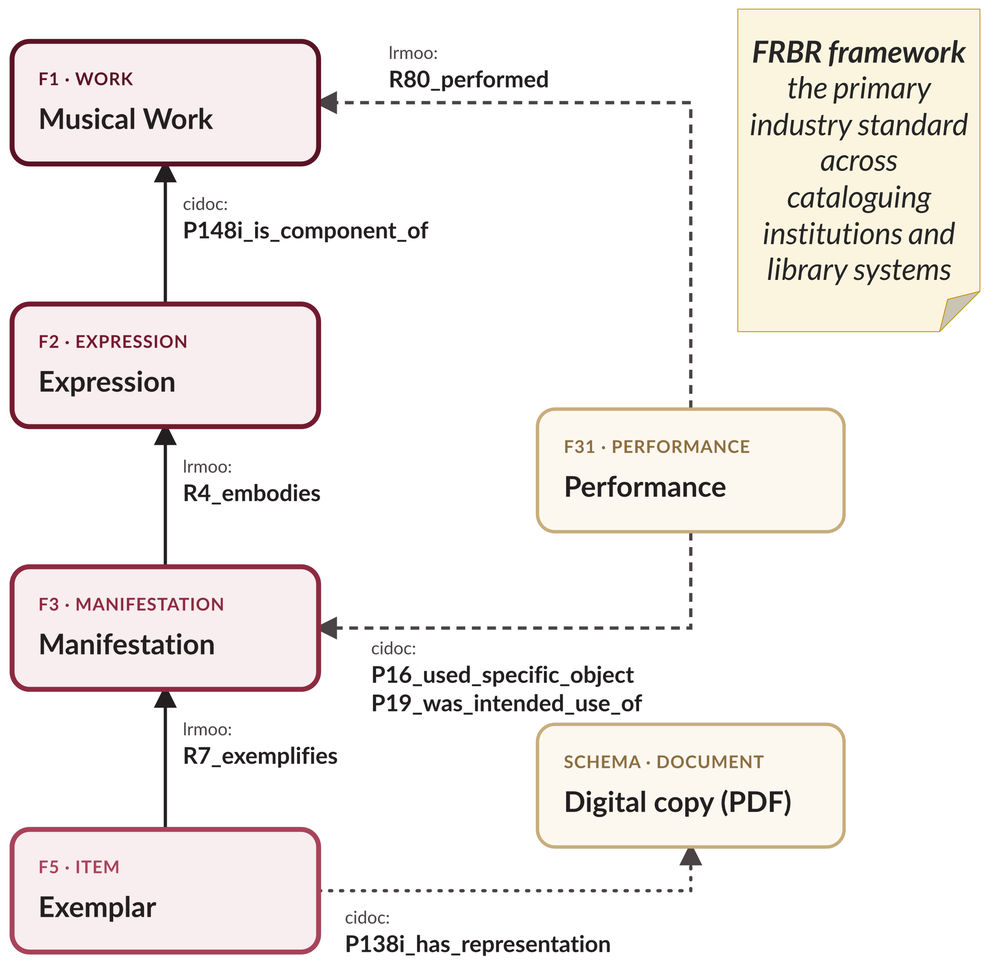

- Opera across the Russian Empire, 1730–1836
- 600+ operas and thousands of source scans
- Dispersed, heterogeneous, multilingual evidence
- Ephemeral performances, material documentary traces
- Complex links among works, translations, sources and events

Need: connected, reliable, adaptable scholarly data
Answer: ontology-aligned, SHACL-driven curation

The WEMI Model

The archive will give access to digital copies of musical sources

The modelling keeps the opera as an idea apart from each version of its textual and musical components, each printed edition, and each surviving copy.

Next Steps

Keep growing *the pragmatic alignment of LRMoo, CIDOC-CRM, and the Polifonia ontologies to capture more aspect of the composite theatrical evidence:*

- *Extend the Data Model*
- *Produce a Browsable UI and release the Data*
- *Publish a Queryable Endpoints*
- *Use to answer Musicology and Philology research questions*
